Disclosure; Fig 2; 69pp; English.

ProTNF refers to TNF having a molecular weight of about 26,000,

which is the prohomone form of TNFa. ProTNF is cleaved to a lower

molecular weight 'mature' form, pref. 17kD, which, in its multimeric

(usually trimeric) form, is substantially involved in producing life-

threatening physiological changes associated with sepsis. ProTNF is

cleaved by convertase. One TNF convertase is serine protease

proteinase-3, also called PR-3, P-299 or myeloblasin. A suitable

source of convertase is the HL60 cell line (or extracts, or the

culture media in which it is grown). The convertase produced by

Culture media in which it is grown). The convertase produced by

serine protease PR-3 which has other activities unrelated to TNF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                        ដ
Claim 2; Columns 43-60; 68pp; English.#
The present sequence is a protein (QA-519) cross-reactive with the haptoglobin related (hpr) gene product. OA-519 can be used raise antibodies reactive with epitopes found on the hpr gene product, but not on haptoglobin 1 or 2, useful in cancer, especially breast cancer, prognosis assays.
                                                                                                                                                                                                                                                                                                                   ö

Patent No. 5437863
CENERAL INFORMATION:
APPLICANT: Williams, David A.
APPLICANT: Clark, Steven C.
TITLE OF INVENTION: Method of Treating Cell Damage or TITLE OF INVENTION: Depletion
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSEE: Howson and Howson
STREET: Spring House Corporate Cntr, P.O. Box 457
CITY: Spring House
CORRESPONDENCE ADDRESS:
ADDRESSEET: Pennsylvania
                                                                                                                                         ö

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.574; Variance 48.443; scale 0.652

FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION. IT BINDS TO THE E2RE RESPONSE ELEMENT (5'-ACCNNNNNGGT-3') PRESENT IN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN EITHER ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION WITH RECARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PAULEY A.;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 2; Fig 2: 35pp: English.

Claim 2: Fig 2: 35pp: English.

The HFGAN/2 receptor protein contains two ligands whose antagonists can be used for treating obesity, diabetes, anorexia nervosa, bullimia, cachexia, chronic renal failure, renal disease, congestive heart failure, impaired glucose tolerance and sexual dysfunction. The agonist is useful for treating anorexia nervosa, bulimia and cachexia. The HFGAN/2 receptor ligand is useful for treating e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, anorexia nervosa, bulimia, cachexia, obesity, diabetes, asthma, Parkinson's disease, both acute and congestive heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, ulcers, asthma, allergies, benign prostatic hypertrophy, chronic renal failure, renal disease, impaired collucose tolerance, sexual dysfunction and psychotic and neurological disorders including anxiety, schizophrenia, manic depression, delirium, dementia, severe mental retardation and dyskinesias such as Huntington's contracts.
                                                                HFGAN72 receptor ligands - and corresponding DNA, agonists

Human GDNE alpha-3 receptor protein #1.
Glial cell line-derived neurotrophic factor alpha-3 receptor; GDNF;
treatment; neurodegenerative disease; Parkinson's Disease; ALS; SMA;
amyotrophic lateral sclerosis; spinal muscular atrophy; nerve; trauma;
Huntington's Disease; Alzheimer's Disease; diabetic neuropathy; muscle;
muscular dystrophy; diagnostic.
                                                                                                                                                                                                                                                                                                                                                                                                                                      ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-SEP-1998 (first entry)

Human GDNF alpha-3 receptor protein #2.

Glial cell line-derived neurotrophic factor alpha-3 receptor; GDNF;

treatment; neurodegenerative disease; Parkinson's Disease; ALS; SNA,

amyotrophic lateral sclerosis; spinal muscular atrophy; nerve; trauma;

Huntington's Disease; Alzheimer's Disease; diabetic neuropathy; muscle;

muscular dystrophy; diagnostic.
                                                                                                                                                                                                                                                                                                      This sequence represents a novel glial cell line-derived neurotrophic factor alpha-3 receptor (GDNF alpha-3). This protein can be used to freat e.g. neurodegenerative diseases (such as Parkinson's Disease, amyotrophic lateral sclerosis (ALS), spinal muscular atrophy (SMA), Huntington's Disease, Alzheimer's Disease, diabetic neuropathy), muscular diseases (including the muscular dystrophies) and nerve and sequence 400 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New factor alpha 3 receptor polypeptide and e.g. DNA and agonists used to treat neuro degenerative diseases, muscular diseases and nerve and muscle trauma and in diagnostic assays claim 13; Fig 4; 22pp; English.
                                                                                                                                                                                                                                                             New factor alpha 3 receptor polypeptide and e.g. DNA and agonists used to treat neuro degenerative diseases, muscular diseases and nerve and muscle trauma and in diagnostic assays claim 4; Fig 2; 22pp; English.

Claim 2: Page 85-86; 113pp; English.

This amino acid sequence comprises human Ret ligand (RetL) RetL3, and clones (see V00251) isolated from a adult heart and spinal cord libraries. Rat and human RetL1, human RetL2 and spinal cord libraries. Rat and human RetL1, human RetL2 and 78 % identical to human RetL3. 34.3% identical to human RetL3. 34.9% identical to human RetL3. 34.9% identical to human RetL3. Set ligand is a key component of the Ret signalling pathway that specifically interacts with Ret receptor protein, triggering Ret dimerisation and/or autophosphorylation of the Ret tyrosine kinase domain.

Wectors containing retL3 DNA and prokaryotic or eukaryotic host and/or autophosphorylation of the Ret tyrosine kinase domain.

Wectors containing retL3 DNA and prokaryotic or eukaryotic host cells transformed or transfected with these vectors are claimed, as well as a method for production of RetL3, its soluble variants and tusion proteins with a toxin, imageable compound or radionuclide.

RetL3, optionally when expressed from vectors in vivo, is used to promote growth of new tissue and survival of damaged tissue,

Particularly kidney or neural tissue. Typical applications are in renal failure, nephritis, kidney transplants, toxic or hypoxic injury, neurodegeneration, moctor neurone disease, multiple sclerosis, bacterial, viral or prion infections (assesse), cranial nerve or spinal cond injury, developmental diseases, untipleral nervous system (Lyme disease, muscular dystrophy and myasthenia gravis).

Fusion proteins are used to deliver toxins etc. to Ret-expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;;
This sequence represents a novel glial cell line-derived neurotrophic factor alpha-3 receptor (GDNF alpha-3). This protein can be used to treat e.g. neurodegenerative diseases (such as Parkinson's Disease, amyotrophic lateral sclerosis (ALS), spinal muscular atrophy (SMA), Huntington's Disease, Alzheimer's Disease, diabetic neuropathy), muscular diseases (including the muscular dystrophies) and nerve and sequence 400 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding ret receptor ligands and related proteins vectors, transformed cells and antibodies, used for promoting cell growth and improving survival of injured cells, especially renal or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  All MAY 1998 (first entry)

Human Ret ligand RetL3.

Ret ligand, RetL3 receptor; signal transduction; human; cell growth; renal cell; nerve cell; renal failure; nephritis; kidney transplant; toxic injury; hypoxic injury; neurodegeneration; motor neurone disease; multiple sclerosis; infection; meningitis; myelopathy; Creutzfeldtd-Jakob disease; caralal nerve injury; spinal cord injury; Down's syndrome; cerebral palsy; Lyme disease; muscular dystrophy;
myastheria gravis; tumour; therapy.

Purified fibulin, DNA encoding it and antibodies reactive with it useful as diagnostic and therapeutic component.

Sclaim 10; Fig 4; 56pp; English.

Claim 10; Fig 4; 56pp; English.

The fibulin A, B and C forms are identical from their N-terminals to a divergence point at posm. 566 (terminal codon in fibulin A)

and 683 residues resp. All three forms are rich in cysteine (11 %) and analysis with on. and spacing of the Cys residues revealed two cys repeat moftli (I and II). The type I motif, CC(X)12c-(X)9c10c(X)6cc is repeated twice, separated by an imperfect form of the repeat lacking two Cys residues. The same motif is found in albumin, vitemin D-binding protein and appha-fectportein. The type II motif, related to repeats found in epidermal growth cisulphide stabilized loop structure is thought to be conserved. The type II motif, related to repeats found in epidermal growth cator precursor is a 6-Cys pattern repeated nine times, although the ninth repeat in the A form is incomplete. Four of the repeats, (2, 3, 4 and 9) differ from the EGF-IIke motif in having a 4-6 cresidue. Embodied within repeats 5, 6, 7 and 8 is the consensus sequence for Asp and Asn hydroxylation. The 7th repeat consensus sequence and repeat is a pentapeptide with the consensus sequence XD(I/V)(N)E. Fibulin binds to the cytorylation is abhesion of the cytorylation in the form of the consensus of plasmit of integrin adhesion consensus sequence is betal subunit of integrin adhesion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         receptors in a cation-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, laminin, and possibly also other proteins. Antibodies reactive with the protein have important diagnostic and therapeutic uses. See also R11147, R11148 and R11150.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human fibulin type 1 isoform (variant B).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   single residue. Embodied within repeats 5, 6, 7 and 8 is the consensus sequence for Asp and Asn hydroxylation. The 7th repeat contains the consensus 0-glycosylation sequence, CXXPR.

Immediately following each repeat is a pentapeptide with the consensus sequence XD(I/V)(D/N)E. Fibulin binds to the cytoplasmic domain of the betal subunit of integrin adhesion coplasmic domain of the betal subunit of integrin adhesion ceceptors in a cation-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, aminin, and possibly also other proteins. Antibodies reactive vith the protein have important diagnostic and therapeutic uses. protein - protein database search, using Smith-Waterman algorithm MPsrch\_pp

Fri Aug 20 21:16:02 1999; MasPar time 8.37 Seconds 588.583 Million cell updates/sec Run on:

Tabular output not generated.

>US-08-938-548B-10 (1-123) from USO8938548B.pep 899 1 VPWAAVTLLLLLPPALLS......GRGCPTVTTALAPRGGSGV 123

Description: Perfect Score: Sequence:

PAM 150 Gap 11 Scoring table:

Searched:

122810 seqs, 40068593 residues

Post-processing:

Minimum Match 0% Listing first 45 summaries

pir60 1:pir1 2:pir2 3:pir3 4:pir4 Database:

Mean 40.175; Variance 83.764; scale 0.480 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 27.574; Variance 124.910; scale 0.221

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 41.468; Variance 75.472; scale 0.549

SUBMITTED (SEP-1993) TO EMBL/GENBANK/DDBJ DATA BANKS.
SUBMITTED (SEP-1993) TO EMBL/GENBANK/DDBJ DATA BANKS.
SUBMITTED (SEP-1993) TO EMBL/GENBANK MATRIX.
SUBGELLGUAR LOCATION: EXTRACELLULAR MATRIX.
CALPARATIVE PRODUCTS: FOUR FORMS OF FIBULIN-1; A (AC P23142), B (AC P23143), C (AC P23144) AND D (SHOWN HERE); DIFFERING ONLY IT THEIR C-TERMINAL REGIONS, ARE PRODUCED BY ALTERNATIVE SPLICING.
SIMILARITY: CONTAINS 3 ANAPHYLATOXIN-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIGNAL; ALTERNATIVE SPLICING; GLYCOPROTEIN; EXTRACELLULAR MATRIX; REPEAT; PLASMA; EGF-LIKE DOMAIN; CALCIUM-BINDING.

"A phosphatidylinositol/phosphatidylcholine transfer protein is

required for differentiation of the dimorphic yeast Yarrowia

I ipolytica from the yeast to the mycelial form.";

J. CELL BIOL. 124.113.127(1994).

C. II. FUNCTION: REQUIRED FOR TRANSPORT OF SECRETORY PROTEINS FROM THE

GOLGI COMPLEX. CATALYZES THE TRANSFER OF PHOSPHATIDYLINOSITOL AND

PHOSPHATIDYLCHOLINE BETWEEN MEMBRANES IN VITRO.

C. II. SUBCELLULAR LOCATION: ASSOCIATED WITH THE GOLGI COMPLEX AS A

PERIPHERAL MEMBRANE PROTEIN (BY SIMILARITY).

C. I. SIMILARITY: BELONGS TO THE SEC14 CYTOSOLIC FACTOR FAMILY.

Mean 39.662; Variance 86.129; scale 0.460 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

J. BIOL. CHEM. 267:25207 (1992).

- FUNCTION: MAY BE INVOLVED IN TRANSDUCTION AND INTERCELLULAR TRANSMISSION OF POLARITY INFORMATION DURING TISSUE MORPHOGENESIS AND/OR IN DIFFERENTIARED TISSUES.

- TISSUE SPECIFICITY: MOST ABUNDANT IN KIDNEY, LIVER, UTERUS, OVARY AND HEART. LOWER LEVELS SEEN IN BRAIN AND INTESTINE.

EXTREMELY LOW IN CALVARIA, MAMMARY GLANDS AND TESTIS.

- ILOWER LEVELS IN ADULT.
                                                                                                                                                                                                                                                                              598 KYCRSK-YETIHGONHDNAADVLELAIKREMPAELL-R-ASLRHTNEDQRNFLLNVGRSA 654
